

OpenAI Claims a Millennium Math Prize as Anthropic Disputes the Credit

TL;DR

- ▶ OpenAI says an unreleased model plus 10,000 parallel agents cracked the \$1M Navier–Stokes math problem in 88 hours — an Anthropic researcher says he'd been chasing the same proof for a year and OpenAI won't confirm it never saw his drafts.
- ▶ Qualcomm and Amazon struck an AI-chip deal reported at up to \$60B, with Amazon also able to acquire up to \$4B in Qualcomm stock — another crack in Nvidia's infrastructure lock.
- ▶ The US–Canada trade war turned real: Canada's \$20B in retaliatory tariffs took effect and Trump called for a ban on planemaker Bombardier, which sources parts from 2,800 US companies.

AI TIPS

use AI better — how to do it

Audit your brand's visibility in AI search

1. Ask Google's AI Overviews and ChatGPT directly about your space and see whether/how your brand or work gets cited.
2. Run free audits with Peekaboo, HubSpot's AI Search Grader, or Semrush's SEO Checker.
3. Check Google Search Console for Generative-AI impression data on your site.
4. Hand the results to your AI agent and have it prioritize the gaps for you.

Paste-ready: Have Codex do these checks for you using the free tools and your accessible reports. Tell it to compile a one-page PDF with your top priorities, target queries, and a quick checklist of improvements.

Give ChatGPT voice control over your desktop

1. Download the new ChatGPT desktop app.
2. Open Work/Codex, enable the Computer Use toggle, and grant permissions.
3. Start a task, turn on Voice, and direct it out loud.
4. To steer a task from your phone instead, enable Remote Control in settings and connect via the mobile app's QR scanner.

AI NEWS

the news — then what it means for you

OpenAI says it solved a \$1M Millennium Prize problem — and a researcher already working on it isn't buying the story. OpenAI ran ~10,000 agents in parallel for 88 hours to produce a proof of the Navier–Stokes singularity problem; an unreleased model handled the proof, then GPT-6 Astra formalized it in Lean. NYU's Tristan Buckmaster and Anthropic's Levent Alpöge say they'd pursued the same result for a year and fed drafts into OpenAI's Codex; OpenAI denies using their work but won't rule out that usage data helped.

What it means for you: Judge frontier AI by what it can do with thousands of agents working in parallel over days, not single prompts — and expect credit disputes like this to recur as agentic research scales.

Qualcomm and Amazon struck an AI-chip deal reported at up to \$60B. Amazon can also acquire up to \$4B in Qualcomm stock as part of the arrangement, which covers custom AI-datacenter inference chips and high-speed connectivity for AWS.

What it means for you: Compute supply keeps diversifying beyond Nvidia — worth flagging for clients on AI-infrastructure vendor risk.

Meta launched Muse, an always-on personal AI agent. It runs tasks — booking, email, shopping — from its own cloud VM via a texting-style interface, integrates with Gmail, Spotify, Ticketmaster, and OpenTable, and rolls out US-only with free and \$20/\$100-per-month tiers.

What it means for you: A serious agent entrant from Meta — add it to the comparison set if clients are evaluating AI-agent vendors.

The US-Canada trade war turned real. Canada's retaliatory tariffs (15-50%) on roughly \$20B of US goods — steel, dairy, appliances, electronics — took effect Sept. 8 after trade talks collapsed; the US countered with more tariffs plus bans on Canadian rye whisky and motorcycles, and Trump called for a ban on sales from planemaker Bombardier, which sources parts from about 2,800 US companies across 47 states.

PM angle: If any client's supply chain touches Canadian imports or exports — steel, agriculture equipment, aerospace parts — this is a live cost and planning risk to flag now, not after Q4 numbers land.

Conversation starter: *Anyone have a client with Canadian suppliers? These tariffs just went from threatened to real — worth checking exposure.*

Apple is expected to debut its first foldable iPhone today — its biggest redesign since the original 2007 launch, and new hardware chief John Ternus's first major event — at roughly \$2,000, about double the iPhone 17 Pro's price.

PM angle: A useful case study in premium-tier product bets: Apple is testing willingness-to-pay at 2x flagship price for a still-niche form factor, since foldables remain a small share of the smartphone market.

Conversation starter: *Would you pay double for a foldable, or is this an early-adopter tax that settles down over a few generations?*

The US Commerce Department took \$100M minority stakes each in three quantum computing firms — D-Wave Quantum, Rigetti Computing, and Quantinuum. Shares popped as much as 10% on the news but remain down 16-32% year-to-date.

PM angle: Government-as-investor in frontier compute is a trend worth watching if you advise clients in tech-adjacent sectors on where public capital and policy attention are heading next.

Conversation starter: *Did you see the government's taking equity stakes in quantum computing startups now? Feels like a new playbook, not just AI chips.*

Thieves stole two Renoir paintings — 1910's portrait of actress Colonna Romano and 1886's Jeune femme au puits (Young Woman at the Well) — from the Renoir Museum in Cagnes-sur-Mer, France, breaching a garden fence and cutting frame bolts in under five minutes despite a fast police response; two other paintings were abandoned in the garden. Source estimates of the stolen works' value vary widely, from roughly \$2.5M combined to \$10.4M each. It follows a string of recent European museum thefts, including the Louvre's roughly \$100M jewel heist last year.

PM angle: No direct relevance to your work, general awareness only.

Conversation starter: *Did you catch there's been a wave of European museum heists this year? The Louvre job wasn't a one-off.*

US domestic box office hit a record \$4.76B from May through Labor Day, edging out the 2013 record, led by Spider-Man: Brand New Day (\$923M) and The Odyssey (\$589M) — though still down 17% versus pre-Covid 2019 once adjusted for inflation.

PM angle: No direct relevance to your work, general awareness only — though for media/entertainment clients, the inflation-adjusted gap versus 2019 is worth having in your back pocket.

Conversation starter: *Box office had its best summer ever, nominally — but adjust for inflation and it's still below 2019. Good reminder to check which number a client is actually citing.*
