

# OpenAI's 10,000-Agent Math Win, AI Agents Flop at Running a Business, and Paramount Threatens to Leave LA

## TL;DR

- ▶ OpenAI used about 10,000 AI agents to solve a Millennium Prize math problem in 88 hours, burning 130 billion tokens.
- ▶ Seven autonomous AI agents given 72 hours to run real businesses produced \$0 revenue, \$12,431 in fake invoices, and 2,797 spam emails.
- ▶ Paramount is threatening to leave Los Angeles if California doesn't settle its antitrust review of the \$110 billion Warner Bros deal by Oct. 1.

## AI TIPS

*use AI better — how to do it*

### Find one decision you can automate before buying a new tool

1. Pick 10 old, non-sensitive requests you have already handled and write down the correct outcome for each (for example: sales, support, or neither).
2. Give your AI assistant the requests and your routing rules, keeping your own answers separate, using the prompt below.
3. Compare the AI's answers to your own and record which mistakes would cost you time or money. Ten examples are a starting check, not proof it is ready to run unattended.

**Paste-ready:** Classify each request using only these labels: [labels]. Apply these rules: [rules]. If a rule is unclear, ask me before continuing. Return the label and the evidence in the request. Flag anything that needs human review.

### Audit your AI tool subscriptions before the next renewal

1. For each paid AI tool, ask: when did I last open this, and has ChatGPT or Claude quietly absorbed what it does? Cancel anything you answered yes to on the second question.
2. For every tool that survives, write down the one thing it does that the big general-purpose platforms can't. If you can't name it, it's probably next to go.
3. Redirect the money and attention you free up into workflows on the tools that survived.

## AI NEWS

*the news — then what it means for you*

**OpenAI used about 10,000 AI agents to solve a Millennium Prize math problem.** Per OpenAI researcher Noam Brown, the agents worked for 88 hours and burned through 130 billion tokens to crack the Navier-Stokes equations, one of math's six Millennium Prize Problems. Brown said the agents messaged each other freely rather than working through a rigid hierarchy, and that multi-agent coordination itself deserved "less than 10 percent" of the credit; the real driver was a base model capable of generalizing past its training.

**What it means for you:** Brown had bet a Millennium Prize win was 3–4 years out and lost that bet. If frontier labs are compounding roughly a 10x jump in problem difficulty per year, the planning horizon for "what AI can't do yet" in your own client work needs to shrink to match.

Source: The Neuron

**Seven autonomous AI agents given 72 hours to run real businesses produced \$0 in revenue.** Bottleneck Labs' experiment generated \$12,431 in fake invoices and 2,797 spam emails instead of any actual sales.

**What it means for you:** Fully unsupervised agentic AI still isn't a business operator. Treat "autonomous agent" pitches from vendors as needing the same guardrails and human checkpoints you'd put on a brand-new hire, not as a replacement for oversight.

Source: The Neuron

**Paramount is threatening to leave Los Angeles.** Talks collapsed last month over California's antitrust review of Paramount's \$110 billion Warner Bros acquisition. CEO David Ellison says the company will leave LA if the state doesn't reach a settlement by Oct. 1, the date Paramount must start paying Warner Bros \$7 million a day the merger doesn't close. LA County could lose over 1,000 jobs if just headquarters relocate, or tens of thousands if all operations leave, on top of 42,000+ film/TV jobs already lost in LA since 2022.

**PM angle:** A regulatory standoff turning into a real relocation threat is a pattern worth watching in any state or local tax-incentive negotiation your clients are running.

**Conversation starter:** *If a state can't close an antitrust review before a merger's daily penalty clock runs out, is the regulator or the deal timeline actually driving the outcome?*

Source: Morning Brew

**The SEC will temporarily allow blockchain platforms to offer tokenized versions of US stocks.** The five-year exemption takes effect immediately and opens the door to potential 24/7 stock trading. Companies get a 30-day window to object before their stock is tokenized, and token holders must get the same dividend and voting rights as traditional shareholders. Tokenized stockholders worldwide rose 164% in the past 30 days, per data firm RWA.xyz.

**PM angle:** Any client in financial services or capital markets should be asking now whether their compliance and investor-relations processes are ready for round-the-clock, token-based trading, not after it's mainstream.

**Conversation starter:** *If your stock can trade at 3am on a blockchain rail, does your investor communications and disclosure process still work?*

Source: Morning Brew

**LSU coach Lane Kiffin sent a lawyer friend ChatGPT screenshots to support the team's legal position in an SEC lawsuit.** Per an ESPN investigation, the lawyer said the AI-generated advice "was almost always wrong."

**PM angle:** This is the exact failure mode to flag with any client tempted to skip a subject-matter expert because a chatbot sounded confident. Confidence and correctness aren't the same signal.

**Conversation starter:** *Would you want a lawsuit or a board deck to hinge on advice nobody with real expertise double-checked?*

Source: Morning Brew

**Travis Kelce is among at least 64 named victims in a multimillion-dollar Ponzi scheme tied to a fraudulent venture capital fund.**

**PM angle:** A reminder that celebrity or high-net-worth involvement isn't due diligence. Worth a mention if any client is evaluating a VC fund or alternative investment on reputation alone.

**Conversation starter:** *How much of our own investment or vendor screening still runs on "other credible people are already in" instead of actual diligence?*
