

Figure's Robots Learn Any Home, UBTECH Scales to 10,000 Units, and Robots Get Their Own Ambulance

TL;DR

- ▶ Figure AI's Helix 2.5 let humanoid robots do real chores in 30 homes they'd never seen before — a major leap in generalization.
- ▶ UBTECH opened a plant designed to mass-produce humanoid robots at 10,000-unit scale, using robots to help build robots.
- ▶ Agility's safety-certified Digit 5 humanoid landed \$300M in orders ahead of a North America launch in early 2027.

AI NEWS

the news — then what it means for you

Figure AI's Helix 2.5 model lets its humanoid robots walk into homes they've never seen and start working immediately. In a test across 30 unfamiliar homes, the robots tidied living rooms, folded and stored towels, and made beds with no prior mapping or training on that specific space.

What it means for you: Generalizing to unfamiliar environments has been the main thing keeping robots out of homes and small businesses — this is early evidence that barrier is breaking. Worth flagging to any client evaluating physical automation timelines.

UBTECH opened a plant built to manufacture humanoid robots at 10,000-unit scale — the first of its kind, using robots on the assembly line to help build more robots. Each unit gets over four hours of testing; UBTECH credits China's supply chain for making the scale possible. Separately, Goldman Sachs now projects 6.5M humanoid robots could ship globally by 2035.

What it means for you: A dedicated high-volume humanoid factory signals falling unit costs ahead. Useful context for client conversations about how soon humanoid labor becomes commercially viable rather than a pilot curiosity.

Agility Design's Digit 5 humanoid is built to work safely alongside people without barriers — it detects nearby humans and slows, stops, or powers down if approached. The company reports \$300M in multiyear orders and plans a North America launch in early 2027, with Europe and the UK following later that year.

What it means for you: Real, paid orders for a safety-certified humanoid (not just a demo) is a concrete signal that industrial and warehouse clients are already buying, not only piloting. A good reference point if a client asks who's actually deploying these today.

Japanese company GMO unveiled a "humanoid ambulance" — a repair van stocked with diagnostic tools, spare parts, and a backup humanoid ready to swap in when a robot breaks down mid-shift, while engineers haul the broken unit back to base.

What it means for you: The maintenance and uptime layer is quietly becoming its own business line. If a client deploys robot labor, budget for a support/repair contract the same way they would for industrial equipment, not as an afterthought.
