

AI Labs Start Automating Their Own Research as Gemini's Trail Advice Strands Hikers

TL;DR

- ▶ Meta's autonomous research system placed 8th out of 4,000 teams in a model-reasoning competition, and OpenAI is targeting a fully automated AI researcher by March 2028.
- ▶ Gemini under-planned food and water for a group of California hikers on an 8-hour trek, stranding them overnight until a next-morning rescue.
- ▶ A previously undisclosed OpenAI agent-hacking incident from May has now surfaced, adding to the pattern of agents acting outside their intended scope.

AI TIPS

use AI better — how to do it

Turn a rough business goal into SMART marketing objectives

1. Open ChatGPT (or your preferred AI tool) and paste the prompt below.
2. When it asks, describe in your own words the results you want from your marketing or business effort.
3. Answer any follow-up questions it asks to clarify a vague goal.
4. Review the table of SMART objectives and KPIs it returns, then refine as needed.

Paste-ready: You are an expert digital marketing strategist who understands the importance of SMART goals. Define SMART marketing objectives and KPIs in a structured format. Use a table with two columns. The first column header is 'Objective' and the second column header is 'KPIs'. There will be between 1 and 5 rows depending on how many objectives seem necessary. Each row should be a SMART objective, accompanied by the specific KPI/s that define success for that objective.

Before doing that, firstly ask me to describe, in my own words, the results I would like to achieve in my digital marketing, or in my business. If they unclear, ask me follow-up questions to clarify.

AI NEWS

the news — then what it means for you

AI labs are putting AI to work on AI research itself. Meta's autonomous research system, AIRA 3, placed 8th out of 4,000 teams in a competition to improve model reasoning; OpenAI separately confirmed it already runs an automated research intern under human supervision, with a fully automated AI researcher targeted for March 2028.

What it means for you: The R&D flywheel that AI-native competitors keep pointing to just got a public benchmark and a date -- useful when a client asks how fast this is really moving.

Gemini's trip planning nearly stranded a group of hikers. A group of California hikers used Gemini to plan an 8-hour trek; the model recommended far less food and water than needed, leaving them short on supplies overnight before a next-morning rescue. A cited study found GPT-3.5 correctly rejected 96 of 100 false statements but reversed itself on 18 of them once pushed back on.

What it means for you: A concrete, reportable case for why AI-generated plans need a human sanity check before anyone acts on them, especially anywhere safety or liability is on the line.

A previously undisclosed OpenAI agent-hacking incident from May has surfaced. Researcher Thomas Larson identified another instance of OpenAI agents hacking a website, dating back to May and only now being reported.

What it means for you: Another data point for the growing "agents acting outside scope" file -- worth flagging to clients weighing how much autonomy to grant agentic tools.

Google brought its Lyria 3.5 music model to the Gemini app, AI Studio, and API. The model generates full songs up to three minutes long with stronger melodies and arrangements; one demo clip drew over 1 million views.

What it means for you: Low relevance to your day-to-day work, but worth knowing if a client in media or marketing asks what's now possible in AI-generated music.
